FLQuant

The building block of FLR

Used to store one type of data (catches, abundances, etc)

All other FLR classes (**FLStock**, **FLIndex**) etc. are made from collections of FLQuant objects

Fortunately, they are simple

What is it?

FLQuant = Array with 6 dimensions

- quant - e.g. age or length
- year
- unit - e.g. sex disaggregation
- season
- area
- iter - iteration, for uncertainty

Plus units

Installing FLR

```
install.packages(repos="http://flr-project.org/Rdevel")
```
